

ServiceNow: Opportunities for Transformation.

ServiceNow made the platform able to act. The opportunity is the layer that makes the enterprise trust it to.

Three signals define this moment. None is about whether the platform works.

They're about whether the enterprise can trust the platform to act.

THE PLATFORM

The platform can now act — for anyone's agent.

Action Fabric opened ServiceNow's full system of action to any AI agent through the GA MCP Server — with Anthropic as the first named design partner. A system of record became a system of action for the whole agent ecosystem.

THE GAP

Adoption is solved. Reliance is not.

ServiceNow runs its own products first, reports ~\$500M in annualized internal-AI value, and handles about 90% of employee IT requests with AI. Yet the market keeps asking: does adoption convert to dependable, outcome-level value?

THE PARTNER

The partner model is on the table.

ServiceNow's own partner briefing is blunt — most engagements are staff augmentation, and their priorities need a different kind of partner that owns outcomes.

The hard part isn't the platform. It's the human layer above it.

ServiceNow has a platform that can act. What it lacks is the layer of human judgment, experience design, and governance that decides whether an agent is trusted to act on a person's behalf — the layer that gets deferred when a company moves this fast and assembles this much through acquisition.

TRUSTED TO ACT

The open seat — the human layer.

Human judgment, experience design, and governance. Deferred when a company moves this fast. The layer Launch fills.

ABLE TO ACT

The platform — system of action.

ServiceNow's Action Fabric. Complete, GA, operating. The base is solid.

The implementer seat is taken. The trust seat is open.

ServiceNow ships the platform, and Accenture, Deloitte, and IBM own implementation. The experience-and-trust layer on top — which actions an agent takes for which person, where a human stays in the loop — is the open seat. Not an implementer's job; a design-and-governance job.

true

PLATFORM & IMPLEMENTATION — TAKEN

Accenture · Deloitte · IBM · ServiceNow. Crowded, entrenched, sold by the hour.

EXPERIENCE & TRUST LAYER — OPEN

Which actions an agent takes, for which person, where a human stays in the loop. One seat, and no generalist can fill it. Launch.

**What if the most powerful
platform in the enterprise stopped
feeling like the hardest one to use?**

We're the one partner already on the other side of this.

Launch can supply what ServiceNow is asking for — and almost no one else in the ecosystem credibly can.

We've built this from the agent's side, in production.

Production MCP client and server infrastructure for regulated clients. Most partners configure Now Assist; we've designed how an agent acts safely inside governed workflows — the experience ServiceNow's own customers are about to need.

BCBS RI · GLOBE LIFE

01

We design from people, not from the platform.

Every decision tied to what a real person needs, with the governance to prove it — the consent surfaces, escalation paths, and role-based scoping between "the agent can act" and "we trust it to."

DESIGN-FROM-PEOPLE

02

We fit the Customer Zero model.

Co-build and validate the trust layer on one workflow inside ServiceNow, then turn it into a market-facing reference. Owning an outcome, not staffing hours.

CUSTOMER ZERO

03

Each reason maps to a real, un-fakeable Launch capability — built from the agent's side, in production.

It starts with one offering. There are five.

Agent Trust Design is the signature — provable inside ServiceNow's own house first, then taken to your market as a reference.

SIGNATURE OFFERING

Agent Trust Design

Turning "the agent can act" into "we trust the agent to act" — the consent surfaces, escalation paths, and role-based scoping on top of Action Fabric.

AND FOUR MORE, EACH COMPOSED FOR WHERE YOU ARE

The Reliance Audit

The honest map of where adoption stops and dependable reliance begins — workflow by workflow.

The Converged Experience

One journey across the assembled platform — so the enterprise reads as one to an employee or customer.

Outcomes, Not Hours

The outcome-based partner model — proven on a single workflow.

Govern-to-Grow

Turning AI Control Tower from a governance dashboard into a decision engine for which agentic use cases to scale.

WHAT THIS MEANS

For ServiceNow, and for the partnership.

A partner who closes the trust gap their own customers are hitting — turning AI maturity into adopted, defensible outcomes, and giving their sales teams a credible answer when a customer asks not "does ServiceNow support agents" but "how do we do this safely."

true

FOR THE PARTNERSHIP.

A differentiated co-sell motion, not a body shop — the kind of partner play that a competitor can't match on price, because it isn't priced by the hour.

Durable pipeline off the existing \$45M base, opening outcome-based expansion.

And a fast, low-risk first proof: one workflow, inside Customer Zero, that becomes a reference both companies take to market — visible inside a quarter.

The conversation worth having with ServiceNow.

A working session with the relevant ServiceNow stakeholders to ground the read, pressure-test where a first proof should sit, and align on what dependable looks like.

01

Adoption to reliance. As you move from AI adoption to AI reliance across your 29,000 employees, where are you finding the biggest gaps — in the technology itself, or in how people are actually working with it day to day?

02

What dependable means. We've been on the client side of building governed MCP infrastructure for regulated industries — and the hardest part is rarely the agent itself. What does "dependable" look like for you when an AI agent is acting autonomously inside your workflows?

03

The proof worth taking to market. ServiceNow is often the Customer Zero for what becomes your go-to-market story. If you were designing one internal proof to take to market in 12 months, which workflow or employee experience would you build it around?

Everything here is a sharp hypothesis built from public signal and our own read — not a finished answer. These questions are how we earn the grounded one.

true

**The layer above the
platform.**

A large developer population, governed adoption, measurable return.

CoverMyMeds needed to move a large engineering organization into AI-assisted development — at the governance and auditability standards required of a McKesson subsidiary in healthcare technology.

CHALLENGE

Governed AI adoption at enterprise scale in a regulated environment where compliance is table stakes and auditability is non-negotiable — but compliance without real adoption yields usage data, not productivity.

APPROACH

Launch deployed its AI development framework starting with the Innovator segment, built the governance and measurement systems, and scaled adoption with evidence at each stage gate — designing for real usage, not just license activation.

OUTCOME

Over 70% developer adoption — not just compliance. 475–600% ROI on the enablement investment. Compliance generates usage data; adoption yields productivity.

DEVELOPER ADOPTION

>70%

Active adoption, not just license compliance

ENABLEMENT ROI

475–600%

Return on the enablement investment

CONTEXT

Regulated

Healthcare technology — McKesson subsidiary;
governance non-negotiable

CLIENT

CoverMyMeds (McKesson subsidiary)

INDUSTRY

Healthcare Technology

WHY IT MATTERS HERE

Nearest proof to the ServiceNow trust-layer argument — governed AI adoption at scale in a regulated, complex org.

Production MCP infrastructure for a regulated payer.

PENDING — write-up from Hem Subbaiyan

Production MCP client and server infrastructure for BCBS Rhode Island — a regulated healthcare payer. This is the agent-side build that underwrites the "we've been on the other side" claim.

- Production deployment, not a proof of concept
- Regulated healthcare context — governance and auditability requirements throughout
- MCP client and server architecture — full agent ecosystem integration

Voice over today if the write-up is not ready. Do not fabricate metrics.

Production MCP build for a regulated insurer.

PENDING — write-up from Hem Subbaiyan

Production MCP build for Globe Life — a regulated insurer, and the second proof point for governed, agent-side enterprise work.

- Production deployment in a regulated insurance context
- MCP architecture — agent-side infrastructure, not platform configuration
- Second reference alongside BCBS RI for the "both sides of this" claim

Voice over today if the write-up is not ready. Do not fabricate metrics.
