

ServiceNow made the platform able to act. The question is whether the enterprise can trust it.

A working conversation on the human layer above the platform — and where Launch has already built it.

Executive Director, Sr. Client Partner

Three signals define this moment. None is about whether the platform works.

They're about whether the enterprise can trust the platform to act.

THE PLATFORM

The platform can now act — for anyone's agent.

Action Fabric opened ServiceNow's full system of action to any AI agent through the GA MCP Server — with Anthropic as the first named design partner. A system of record became a system of action for the whole agent ecosystem.

THE GAP

Adoption is solved. Reliance is not.

ServiceNow runs its own products first, reports ~\$500M in annualized internal-AI value, and handles about 90% of employee IT requests with AI. Yet the market keeps asking: does adoption convert to dependable, outcome-level value?

THE PARTNER

The partner model is on the table.

ServiceNow's own partner briefing is blunt — most engagements are staff augmentation, and their priorities need a different kind of partner that owns outcomes.

The hard part isn't the platform. It's the human layer above it.

ServiceNow has a platform that can act. What it lacks is the layer that decides whether an agent is *trusted* to act on a person's behalf.

TRUSTED TO ACT

The open seat — the human layer.

Human judgment, experience design, and governance. The layer that gets deferred when a company moves this fast and assembles this much through acquisition.

ABLE TO ACT

The platform — system of action.

ServiceNow's Action Fabric. Complete, GA, operating. The base is solid — the layer above it is not yet built.

The implementer seat is taken. The trust seat is open.

ServiceNow ships the platform, and Accenture, Deloitte, and IBM own implementation. The experience-and-trust layer on top — which actions an agent takes for which person, where a human stays in the loop — is the open seat. Not an implementer's job; a design-and-governance job.

Tresa Gowland

PLATFORM & IMPLEMENTATION — TAKEN

Accenture · Deloitte · IBM · ServiceNow. Crowded, entrenched, sold by the hour.

EXPERIENCE & TRUST LAYER — OPEN

Which actions an agent takes, for which person, where a human stays in the loop. One seat, and no generalist can fill it. Launch.

We're the one partner already on the other side of this.

Launch can supply what ServiceNow is asking for — and almost no one else in the ecosystem credibly can.

We've built this from the agent's side, in production.

Production MCP client and server infrastructure for regulated clients. Most partners configure Now Assist; we've designed how an agent acts safely inside governed workflows — the experience ServiceNow's own customers are about to need.

BCBS RI · GLOBE LIFE

01

We design from people, not from the platform.

Every decision tied to what a real person needs, with the governance to prove it — the consent surfaces, escalation paths, and role-based scoping between "the agent can act" and "we trust it to."

DESIGN-FROM-PEOPLE

02

We fit the Customer Zero model.

Co-build and validate the trust layer on one workflow inside ServiceNow, then turn it into a market-facing reference. Owning an outcome, not staffing hours.

CUSTOMER ZERO

03

Each reason maps to a real, un-fakeable Launch capability — built from the agent's side, in production.

It starts with one offering. There are five.

Agent Trust Design is the signature — provable inside ServiceNow's own house first, then taken to your market as a reference.

SIGNATURE OFFERING

Agent Trust Design

Turning "the agent can act" into "we trust the agent to act" — the consent surfaces, escalation paths, and role-based scoping on top of Action Fabric.

AND FOUR MORE, EACH COMPOSED FOR WHERE YOU ARE

The Reliance Audit

The honest map of where adoption stops and dependable reliance begins — workflow by workflow.

The Converged Experience

One journey across Moveworks, Armis, Veza, and Now Assist — so the assembled platform reads as one to an employee or customer.

Outcomes, Not Hours

The outcome-based partner model they've said they want — proven on a single workflow.

Govern-to-Grow

Turning AI Control Tower from a governance dashboard into a decision engine for which agentic use cases to scale.

WHAT THIS MEANS

For ServiceNow, and for your number.

A partner who closes the trust gap their own customers are hitting — turning AI maturity into adopted, defensible outcomes, and giving their sales teams a credible answer when a customer asks not "does ServiceNow support agents" but "how do we do this safely."

Tresa Gowland

FOR YOU, SMITA.

A differentiated co-sell motion, not a body shop — the AWS-style partner play you know, the piece of NTT a competitor can't match on price because it isn't priced by the hour.

Durable pipeline off the existing \$45M base, opening outcome-based expansion.

And a fast, low-risk first proof: one workflow, inside Customer Zero, that becomes a reference both companies take to market — visible three months in.

One workflow. A couple of conversations. That's the whole ask.

Sponsor Launch into a small set of listening sessions with the ServiceNow team — starting with the Customer Health Assurance group, where NTT already has a supporter. One or two structured conversations turn this read into a grounded, ServiceNow-specific plan.

The window is now: the pursuit is live and the next ServiceNow touchpoints are weeks out, not quarters.

Everything here is a sharp hypothesis built from public signal and our account read — not a finished answer. We're asking for the access that lets us earn one.
